

Info Update 30 April 2010

All 3cc and 1cc syringe parts moulds were completed on 15 April 2010 and all syringe parts, including the part which was re-configured, have been produced. Testing of the parts, with one exception, was completed on 21 April. Fine adjustments to the tolerances of the seals will be done when we have completed a production run of cells produced by our prototype manufacturing process. When that aspect of our project is complete we will test friction fit tolerances. This final tolerance adjustment to the seals, if in fact needed at all after testing is complete, will be in the order of 0.001" (one one thousandths of an inch).
